

## Amendments to the Specification

**Please replace the text on page 9 with the following:**

An operating environment ~~simulation~~ emulation system. ~~The system includes a separate~~  
peripheral ~~simulation~~ emulation system having a memory device. The memory device is  
operable to store one or more executable programs, referred to as ~~simulators~~ emulators. The  
~~simulators~~ emulators are operable to ~~simulate~~ emulate an original operating environment.  
Multiple ~~simulators~~ emulators may be deployed on the ~~simulation~~ emulation system to allow  
execution and presentation of an original operating environment on several different host  
computers. The system also includes a method for connecting the ~~simulation~~ emulation system  
to a host computer or accessory device upon which the ~~simulation~~ emulation will run. The  
~~simulator~~ emulator may employ insulation processes to limit interaction between the ~~simulation~~  
emulation system and host computer resources.
